

IN THE CLAIMS

Please amend the claims of the present application as follows:

1. (currently amended) A method for preparing an anti-theft paper register receipt roll for [preventing the unauthorized removal of a paper roll] from a retailer, comprising:
providing a rigid plastic core with an electronic sensor secured thereto, the core having a length of between 2 1/4 and 3 1/4 inches to facilitate its use within a register and wherein the sensor produces a detectable signal;
[affixing to the paper roll an electronic sensor, wherein the sensor produces a detectable signal;] winding a length of thermal ink paper over the rigid plastic core, the thermal ink paper having a length that corresponds to the length of the rigid plastic core; and
detecting the signal from the sensor when it passes through or near a detection zone at the retailer's location, thereby preventing unauthorized removal of the paper roll.
2. (currently amended) The method of claim 1, wherein the sensor is secured to the outside surface of the rigid plastic core. [the paper roll comprises a core, and wherein the method further comprises affixing the sensor to the core.]
3. (canceled) An anti-theft paper roll comprising a paper roll having an electronic sensor affixed thereto.
4. (canceled) The anti-theft paper roll of claim 3, wherein the paper roll comprises a core, and wherein the sensor is affixed to the core.
5. (currently amended) [A paper roll core comprising] The method as described in claim 1 wherein the rigid plastic core includes a hollow cylinder having an interior surface and an exterior surface, between which surfaces is a core wall, and wherein the exterior surface

further comprises a longitudinal flat surface integrally formed therein.

6. (currently amended) An electronic article surveillance system [for protecting a paper roll from theft,] comprising: [means for generating an electronic signal from a sensor at a selected frequency, wherein the sensor is affixed to the paper roll; and means for detecting the signal generated by the sensor when the sensor is in the proximity of a detection zone.]

a rigid cylindrical core having a length of between 2 1/4 to 3 1/4 inches;

a sensor interconnected to the core, the sensor producing a detectable signal;

a length of register receipt paper wound about the core and sensor; the core and register

receipt paper together constituting the register receipt roll;

a detector for detecting the signal generated by the sensor so as to prevent the

unauthorized removal of the register receipt roll.

7. (currently amended) The system of claim 6, wherein [the paper roll comprises a core, and wherein the sensor is affixed to the core.] the regular receipt paper is thermal paper.
8. (currently amended) The system of claim [7] 6, wherein the core further comprises an exterior surface with a flat surface integrally formed thereon, and wherein the system further comprises affixing the sensor to the flat surface of the core.
9. (originally presented) The system of claim 6, wherein the signal activates an alarm.
10. (originally presented) The system of claim 9, wherein the alarm is at least one audible indicator, visual indicator, silent alarm having a remote indicator, or activation of a physical blocking means, and combinations thereof.
11. (originally presented) The system of claim 9, wherein the alarm is recognized at a remote location.

12. (originally presented) The system of claim 9, wherein the alarm is recognized proximal to the detection zone.
